4. Site description

4.1 Site characteristics

Il sito è caratterizzato da un substrato argilloso-impermeabile che favorisce il naturale ristagno d'acqua e la formazione di numerose aree umide temporanee. Inoltre, anche le numerose cave di argilla abbandonate presenti nell'area sono state colonizzate da molte specie acquatiche, contribuendo alla ricchezza florofaunistica di questo territorio. Infine, l'area è situata in un'area pianiziale-collinare caratterizzata da una bassa pressione antropica e la presenza di ampie aree boscate che determinano un elevato grado di naturalità e un buon stato conservazionistico delle specie e degli habitat presenti.

4.2 Quality and importance of the site

Sito interessante in particolare per la presenza di numerosi ambienti acquatici temporanei e di porzioni residue di boschi umidi pianiziali. Il sito presenta una ricca batracofauna e ospita numerose popolazioni di *Tritus canifex* e *Lissotriton vulgaris meridionalis*, specie estremamente rare nel Piemonte occidentale. Nel sito, inoltre, sono presenti specie vegetali acquatiche rare, anche se non organizzate in popolamenti ben definiti. Nell'area è segnalata anche *Melitaea deione*, specie di lepidottero assai raro in Italia.
